

## Secchi Dip-In

A secchi disk measures the turbidity of a body of water which will help us gather data on the water clarity at Pigeon Lake. Turbidity is a result of high concentrations of sediments and biota such as phytoplankton.

## **Secchi Disk Protocol:**

- 1. Slowly lower the Secchi disk into the water on the shady side of the boat until it is no longer visible. Use the marks on the string to measure and record the depth. (do not wear sunglasses as this can cause an inaccurate reading)
- **2.** Gradually raise the disk until it just becomes visible again. Use the marks on the string to measure and record the depth
- **3.** Add the depths from steps 1 and 2 and divide by two to get an average. This average is your Secchi depth.
- **4.** This may be repeated for a measurement of precision.

This sheet is used to record the information you gather. Once your data has been recorded, we ask that you transfer the information to our digital form or scan and email the form to plwastaff@gmail.com

The online version of the form is available through this link: https://forms.gle/GaxXViuupQamzRke7

All forms are also available on the PLWA website - Secchi Dip-In section

Measured Secchi depth:	(cm)
Date of Observation	
dd/mm/yyyy	
Time of Observation:	AM or PM
Latitude:	
Longitude:	
Weather  Sunny Partly Cloudy Overcast	
☐ Rain  Was the disk resting on the bottom of the	e lake? Yes / No
What is the general water quality of the  Beautiful, No Problems  Minor Problems  Slight Use Impairment  Substantial Impairment  Use Totally Impaired	
Has the quality changed in the past year  Better Worse No change Don't know	?

Measure the transparency at any time. Please do not do the Dip-In if it is raining, if there is abnormally high boat traffic, or if there are any unsafe conditions. A clear, calm day is best.

Thank you so much for your time and dedication to Pigeon Lake!
